# CONSTRUCTION OF NEW GYROGROUPS AND THE STRUCTURE OF THEIR SUBGYROGROUPS 

SOHEILA MAHDAVI, ALI REZA ASHRAFI* AND MOHAMMAD ALI SALAHSHOUR

#### Abstract

Suppose that $G$ is a groupoid with binary operation $\otimes$. The pair $(G, \otimes)$ is said to be a gyrogroup if the operation $\otimes$ has a left identity, each element $a \in G$ has a left inverse and the left gyroassociative law and the left loop property are satisfied in $G$. In this paper, a method for constructing new gyrogroups from old ones is presented and the structure of subgyrogroups of these gyrogroups are also given. As a consequence of this work, five 2 -gyrogroups of order $2^{n}, n \geq 3$, are presented. Some open questions are also proposed.

## 1. Introduction

A groupoid $G$ with a binary operation $\oplus$ is called a gyrogroup if the following hold:

- there exists an element $0 \in G$ such that for all $x \in G, 0 \oplus x=x$;
- for each $a \in G$, there exists $b \in G$ such that $b \oplus a=0$;

[^0]－there exists a function gyr ：$G \times G \longrightarrow \operatorname{Aut}((G, \oplus))$ such that for every $a, b, c \in G$ ， $a \oplus(b \oplus c)=(a \oplus b) \oplus \operatorname{gyr}[a, b] c$ ，where $\operatorname{gyr}[a, b] c=\operatorname{gyr}(a, b)(c)$ ；
－for each $a, b \in G, \operatorname{gyr}[a, b]=\operatorname{gyr}[a \oplus b, b]$ ．
Note that these axioms imply their right counterpart．It is easy to see that a group is a gyrogroup if we define the gyroautomorphisms to be the identity automorphism．For every $a, b \in G$ ，the mapping $\operatorname{gyr}[a, b]$ is called the gyroautomorphism generated by $a$ and $b$ ．The gyrogroup structure is a result of a pioneering work of Abraham Ungar in the study of Lorentz group［10，11］．Following Ferreira［1］，Sect．4］，suppose that $T$ is a gyrogroup and $H$ is a nonempty subset of $T$ ．$H$ is a subgyrogroup of $T$ ，written $H \leq G$ ，if $H$ is a gyrogroup under the operation inherited from $T$ and the restriction of $\operatorname{gyr}[a, b], a, b \in H$ ，to $H$ becomes an gyroautomorphism of $H$ ．It is merit to mention here that Ferreira used the term＂gyrosub－ group＂and the term＂subgyrogroup＂was first used in［7］．The subgyrogroup $H$ is normal in $T$ ，written $H \unlhd T$ ，if it is the kernel of a gyrogroup homomorphism from $T$ to another gy－ rogroup［7］．The subgyrogroup $H$ of $T$ is said to be an $L$－subgyrogroup，denoted by $H \leq_{L} G$ ， if $\operatorname{gyr}[a, h](H)=H$ ，for all $a \in G$ and $h \in H$ ，see［3，Definition 8］for more details．

Suppose that $(K, \oplus)$ is a gyrogroup．The gyrogroup cooperation or coaddition $⿴ 囗 十$ is a second binary operation on $K$ defined as $a \boxplus b=a \oplus \operatorname{gyr}[a, \ominus b] b$ ，for all $a, b \in K$ ．It is well－known that $(K, \boxplus)$ is a loop named cogyrogroup，which shares its automorphism group with its associated gyrogroup（ $K, \oplus$ ），see 14，Theorem 2．26］for details．

Suppose that $L$ is a gyrogroup，$A, B$ are subsets of $G$ and $a \in A, b \in B$ ．Following Suksumran ［4，Definition 3．13］， $\operatorname{conj}_{a}(b)=(a \oplus b)$ घ $a$ is called the conjugate of $b$ by $a$ and $\operatorname{conj}_{a}(B)=$ $\{(a \oplus b) \boxminus a \mid b \in B\}$ is named the conjugate of $B$ by $a$ ．For simplicity of our argument，we set $\operatorname{conj}_{A}(B)=\left\{\operatorname{conj}_{a}(B) \mid a \in A\right\}$ ．

For the sake of completeness，we mention here two interesting results of Suksumran．These are Theorem 31 and Proposition 38 in［3］，respectively．

Theorem 1．1．Let $G$ be a gyrogroup and let $H$ be a subgyrogroup of $G$ ．Then the following hold：
（1）$H \unlhd G$ if and only if the operation on the coset space $G / H$ given by $(a \oplus H) \oplus(b \oplus H)=$ $(a \oplus b) \oplus H$ is well defined．
（2）Suppose the following conditions are satisfied：
（a） $\operatorname{gyr}[h, a]=i d_{G}$ ，for all $h \in H$ and $a \in G$ ；
（b） $\operatorname{gyr}[a, b](H) \subseteq H$ ，for all $a, b \in G$ ；
（c）$a \oplus H=H \oplus a$ ，for all $a \in G$ ．
Then $H \unlhd G$ ．

Throughout this paper our notations are standard and can be taken mainly from [2, 12]. We refer the interested readers to consult the survey [9] for a complete history of gyrogroups. We also refer to [6, 7] for subgyrogroups, gyrogroup homomorphisms and quotient gyrogroups.

## 2. Preliminaries

The aim of this section is to first construct a new class of finite gyrogroups. Then the main properties of this class of gyrogroups will be investigated. Suppose that $H$ is a group and $A$ is a set, $A \cap H=\varnothing$ and $A$ has the same size as $H$. Choose a bijective map $\varphi: H \longrightarrow A$ and set $G=A \cup H$. Define the binary operation $\otimes$ on $G$ as follows:

$$
a \otimes b=\left\{\begin{array}{ll}
a b & a, b \in H \\
\varphi\left(\varphi^{-1}(a) b\right) & a \in A, b \in H \\
\varphi\left(a \varphi^{-1}(b)\right) & a \in H, b \in A \\
\varphi^{-1}(a) \varphi^{-1}(b) & a, b \in A
\end{array} .\right.
$$

Then it is easy to see that $(G, \otimes)$ is a group under the operation $\otimes$. We now present some notations that help us to generalize this result to gyrogroups.

Suppose $\left(H^{+}, \oplus\right)$ is a gyrogroup, $H^{-}$is a set disjoint from $H^{+}$and $\varphi: H^{+} \longrightarrow H^{-}$is a bijective map. An arbitrary element of $H^{+}$is denoted by $x^{+}$, and define $x^{-}=\varphi\left(x^{+}\right)$, $G=H^{+} \cup H^{-}$and

$$
a^{\varepsilon} \otimes b^{\delta}=\left\{\begin{array}{ll}
a^{+} \oplus b^{+} & (\varepsilon, \delta)=(+,+) \text { or }(-,-) \\
\left(a^{+} \oplus b^{+}\right)^{-} & (\varepsilon, \delta)=(+,-) \text { or }(-,+)
\end{array},\right.
$$

where $a, b \in G$.
We are now ready to state our first result:
Theorem 2.1. $(G, \otimes)$ is a gyrogroup and the gyrator gyr $_{G}: G \times G \longrightarrow$ Aut $(G)$ is defined as:

$$
\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(t^{\gamma}\right)= \begin{cases}g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(t^{+}\right) & \gamma=+ \\ \left(g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(t^{+}\right)\right)^{-} & \gamma=-\end{cases}
$$

Proof. Suppose that $0^{+}$is the identity of $H^{+}$. Then, it is easy to see that for each $a \in G$, $0^{+} \otimes a=a$. For $x^{\varepsilon} \in G$, we define

$$
\otimes x^{\varepsilon}=\left\{\begin{array}{cc}
\ominus x^{+} & \varepsilon=+ \\
\left(\Theta x^{+}\right)^{-} & \varepsilon=-
\end{array} .\right.
$$

Then by definition of $\otimes, x^{\varepsilon} \otimes\left(\otimes x^{\varepsilon}\right)=\left(\otimes x^{\varepsilon}\right) \otimes x^{\varepsilon}=0^{+}$. Here, the notation $\otimes x$ is used for the inverse of an arbitrary element $x \in G$. To prove that $\operatorname{gyr}_{G}[a, b] \in \operatorname{Aut}(G)$, we first show that $\operatorname{gyr}_{G}[a, b]$ is a gyrogroup homomorphism. We have two separate cases as follows:

1. $(\gamma, \lambda)=(+,+)$ or $(-,-)$. In this case, by definition of gyrogroup homomorphism,

$$
\begin{aligned}
\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(x^{\gamma} \otimes y^{\lambda}\right) & =\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(x^{+} \oplus y^{+}\right) \\
& =\operatorname{gyr}_{H^{+}}\left[a^{+}, b^{+}\right]\left(x^{+} \oplus y^{+}\right) \\
& =\operatorname{gyr}_{H^{+}}\left[a^{+}, b^{+}\right] x^{+} \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right] y^{+} \\
& =\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right] x^{\gamma} \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right] y^{\lambda} .
\end{aligned}
$$

2. $(\gamma, \lambda)=(+,-)$ or $(-,+)$. In this case, we have

$$
\begin{aligned}
\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(x^{\gamma} \otimes y^{\lambda}\right) & =\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(\left(x^{+} \oplus y^{+}\right)^{-}\right) \\
& =\left(g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(x^{+} \oplus y^{+}\right)\right)^{-} \\
& =\left(g y r_{H^{+}}\left[a^{+}, b^{+}\right] x^{+} \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right] y^{+}\right)^{-} \\
& =\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right] x^{\gamma} \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right] y^{\lambda} .
\end{aligned}
$$

This proves that $\operatorname{gyr}_{G}[a, b]$ is a gyrogroup homomorphism. A case by case investigation shows that $\operatorname{gyr}_{G}[a, b]$ is one-to-one and so it is an automorphism of the groupoid $(G, \otimes)$. In what follows, the gyroassociative law is investigated in two different cases. To do this, we assume that $a^{\varepsilon}, b^{\delta}$ and $c^{\gamma}$ are arbitrary elements of $G$. We first assume that $\gamma=+$. Then,

1. $(\varepsilon, \delta)=(+,+)$ or $(-,-)$. A simple calculation shows that

$$
\begin{aligned}
a^{\varepsilon} \otimes\left(b^{\delta} \otimes c^{+}\right) & =a^{+} \oplus\left(b^{+} \oplus c^{+}\right) \\
& =\left(a^{+} \oplus b^{+}\right) \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+} \\
& =\left(a^{+} \oplus b^{+}\right) \otimes g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+} \\
& =\left(a^{\varepsilon} \otimes b^{\delta}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right] c^{+} .
\end{aligned}
$$

2. $(\varepsilon, \delta)=(-,+)$ or $(+,-)$. In this case, we have:

$$
\begin{aligned}
a^{\varepsilon} \otimes\left(b^{\delta} \otimes c^{+}\right) & =\left(a^{+} \oplus\left(b^{+} \oplus c^{+}\right)\right)^{-} \\
& =\left(\left(a^{+} \oplus b^{+}\right) \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+}\right)^{-} \\
& =\left(a^{+} \oplus b^{+}\right)^{-} \otimes g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+} \\
& =\left(a^{\varepsilon} \otimes b^{\delta}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right] c^{+} .
\end{aligned}
$$

Next we assume that $\gamma=-$. Then

1. $(\varepsilon, \delta)=(+,+)$ or $(-,-)$. A simple calculation shows that

$$
\begin{aligned}
a^{\varepsilon} \otimes\left(b^{\delta} \otimes c^{-}\right) & =\left(a^{+} \oplus\left(b^{+} \oplus c^{+}\right)\right)^{-} \\
& =\left(\left(a^{+} \oplus b^{+}\right) \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+}\right)^{-} \\
& =\left(a^{+} \oplus b^{+}\right) \otimes\left(g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+}\right)^{-} \\
& =\left(a^{\varepsilon} \otimes b^{\delta}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right] c^{-} .
\end{aligned}
$$

2. $(\varepsilon, \delta)=(-,+)$ or $(+,-)$. In this case, we have:

$$
\begin{aligned}
a^{\varepsilon} \otimes\left(b^{\delta} \otimes c^{-}\right) & =a^{+} \oplus\left(b^{+} \oplus c^{+}\right) \\
& =\left(a^{+} \oplus b^{+}\right) \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+} \\
& =\left(a^{+} \oplus b^{+}\right)^{-} \otimes\left(g y r_{H^{+}}\left[a^{+}, b^{+}\right] c^{+}\right)^{-} \\
& =\left(a^{\varepsilon} \otimes b^{\delta}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right] c^{-}
\end{aligned}
$$

This proves that the gyroassociative lave is valid. To complete the proof, we have to prove the left loop property. To de this, we first assume that $\gamma=+$. Then,

$$
\begin{aligned}
\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(t^{+}\right) & =g y r_{H^{+}}\left[a^{+}, b^{+}\right] t^{+} \\
& =\operatorname{gyr}_{H^{+}}\left[a^{+} \oplus b^{+}, b^{+}\right] t^{+} \\
& =\operatorname{gyr}_{G}\left[a^{\varepsilon} \otimes b^{\delta}, b^{\delta}\right] t^{+},
\end{aligned}
$$

as desired. Next we assume that $\gamma=-$. In these cases, we have

$$
\begin{aligned}
\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(t^{-}\right) & =\left({\left.g y r_{H^{+}}\left[a^{+}, b^{+}\right] t^{+}\right)^{-}}=\left(\operatorname{gyr}_{H^{+}}\left[a^{+} \oplus b^{+}, b^{+}\right] t^{+}\right)^{-}\right. \\
& =\operatorname{gyr}_{G}\left[a^{\varepsilon} \otimes b^{\delta}, b^{\delta}\right] t^{-}
\end{aligned}
$$

which completes the proof.

From now on, $\left(H^{+}, \oplus\right)$ is an arbitrary gyrogroup and $(G, \otimes)$ is its associated gyrogroup constructed in Theorem 2.1.

Corollary 2.2. Let $H^{+}$and $G$ be gyrogroups as in Theorem 2.1. Then $H^{-}=0^{-} \otimes H^{+}$and $G=H^{+} \cup\left(0^{-} \otimes H^{+}\right)$, where $0^{-}=\varphi\left(0^{+}\right)$.

Proof. By Theorem 2.1,

$$
\begin{aligned}
0^{-} \otimes H^{+} & =\left\{0^{-} \otimes h^{+} \mid h^{+} \in H^{+}\right\} \\
& =\left\{\left(0^{+} \oplus h^{+}\right)^{-} \mid h^{+} \in H^{+}\right\} \\
& =\left\{\left(h^{+}\right)^{-} \mid h^{+} \in H^{+}\right\} \\
& =H^{-} .
\end{aligned}
$$

Thus $G=H^{+} \cup H^{-}=H^{+} \cup\left(0^{-} \otimes H^{+}\right)$.

Corollary 2.3. If $\left(H^{+}, \oplus\right)$ is gyrocommutative then $(G, \otimes)$ is also gyrocommutative.
Proof. Suppose $a^{\varepsilon}$ and $b^{\delta}$ are arbitrary in $G$. We consider two separate cases as follows:

1. $(\varepsilon, \delta)=(+,+)$ or $(-,-)$. A simple calculation shows that

$$
\begin{aligned}
\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(b^{\delta} \otimes a^{\varepsilon}\right) & =\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(b^{+} \oplus a^{+}\right) \\
& =g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(b^{+} \oplus a^{+}\right) \\
& =a^{+} \oplus b^{+} \\
& =a^{\varepsilon} \otimes b^{\delta} .
\end{aligned}
$$

2. $(\varepsilon, \delta)=(-,+)$ or $(+,-)$. In this case, we have:

$$
\begin{aligned}
\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(b^{\delta} \otimes a^{\varepsilon}\right) & =\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(\left(b^{+} \oplus a^{+}\right)^{-}\right) \\
& =\left(g y r_{H^{+}}\left[a^{+}, b\right]\left(b^{+} \oplus a^{+}\right)\right)^{-} \\
& =\left(a^{+} \oplus b^{+}\right)^{-} \\
& =a^{\varepsilon} \otimes b^{\delta} .
\end{aligned}
$$

This completes the proof.

A nondegenerate gyrogroup is a gyrogroup which is not a group. A simple calculation by Gap [8] shows that there is no nondegenerate gyrogroup of order $\leq 7$. On the other hand, our calculations recorded in Tables 1 and 2 show that the quasigroups $K(1), L(1), M(1), N(1)$ and $O(1)$ are gyrogroups of order 8 , but we do not have an efficient algorithm to construct all gyrogroups of this order. So, it is natural to ask the following question:

Question 2.4. How many gyrogroups of order 8 are there up to isomorphism?

In Tables 1 and 2，the Cayley tables and its associated gyration tables of the gyrogroups $\left(K(1), \oplus_{K}\right),\left(L(1), \oplus_{L}\right),\left(M(1), \oplus_{M}\right),\left(N(1), \oplus_{N}\right)$ and $\left(O(1), \oplus_{O}\right)$ of order 8 are given． For simplicity of our argument，the underlying set of each gyrogroup is assumed to be $\{0,1,2,3,4,5,6,7\}$ ．In these tables，$A=(4,5)(6,7), B=C=(2,3)(4,5), D=(2,3)(6,7)$ and $E=(4,5)(6,7)$ are automorphisms of the quasigroups $K(1), L(1), M(1), N(1)$ and $O(1)$ ， respectively．

Suppose that $⿴ 囗 十$ and $\boxtimes$ are coadditions of $\oplus$ and $\otimes$ in the gyrogroups $H^{+}$and $G$ ，respectively． It is usual to use the notations $\boxminus x$ and $\nabla x$ for the inverse of $x$ with respect to $⿴ 囗 十 \boldsymbol{~ a n d} \boldsymbol{\otimes}$ ， respectively．For each $a^{\varepsilon}, b^{\delta} \in G$ ，we have：

$$
a^{\varepsilon} \boxtimes b^{\delta}= \begin{cases}a^{+} \text {曰 } b^{+} & (\varepsilon, \delta)=(+,+) \text { or }(-,-), \\ \left(a^{+} \text {曰 } b^{+}\right)^{-} & (\varepsilon, \delta)=(+,-) \text { or }(-,+) .\end{cases}
$$

Example 2．5．Suppose that $R$ is a gyrogroup，$S$ is a normal subgyrogroup of $R$ and $a \in R$ ． By［3，Proposition 39］，$a \oplus S=S \oplus a$ and so $(a \oplus S) \boxminus a=(S \oplus a) \boxminus a=S$ ．Hence $S=\operatorname{conj}_{a}(S)$ ． However，the converse is not generally true．To see this，we consider the gyrogroup $K(1)$ of order 8 introduced in Table 1 and set $P=\{0,2\}$ ．It is easy to see that $P=\operatorname{conj}_{a}(P)$ ．If $P$ is normal in $K(1)$ then by［3，Theorem 32］，$(a \oplus b) \oplus P=a \oplus(P \oplus b)=(a \oplus P) \oplus b$ ，where $a$ and $b$ are arbitrary elements of $K(1)$ ．Suppose that $a=5$ and $b=6$ ．Then $(5 \oplus 6) \oplus\{0,2\}=$ $\{3,1\} \neq(5 \oplus\{0,2\}) \oplus 6=\{3,0\}$ ．This proves that $P$ is not normal in $K(1)$ ．

Question 2．6．Find a condition on the gyrogroup $L$ such that all subgyrogroups $T$ of $L$ satisfy the following condition：

$$
\forall a \in L, \operatorname{conj}_{a}(T)=T \Leftrightarrow T \unlhd L
$$

Following Suksumran［5］，let $L$ be a gyrogroup and let $a, b \in L$ ．The commutator $[a, b]$ is defined as $[a, b]=\ominus(a \oplus b) \oplus g y r[a, b](b \oplus a)$ and the derived subgroup $L^{\prime}$ is the subgyrogroup generated by all commutators．The author of the mentioned paper also noted that unlike the situation in group theory，it is still an open problem whether the derived subgyrogroup of a gyrogroup $L$ ，is normal in $L$ ．Suppose that $L$ is a group and $T$ is a subgroup of $L$ ．It is an elementary fact that if $L^{\prime} \leq T$ then $T$ is normal in $L$ ．This is a generalization of the normality of derived subgroup．Again consider the subgyrogroup $P$ of $M$ presented in Example 2.5 and Table 1．Then $M^{\prime}=\{0\} \leq P$ ，but $P$ is not normal in $K$ ．Hence the following question is natural：

Question 2．7．Find a condition on the gyrogroup $L$ such that for all subgyrogroups $T$ of $L$ ， $L^{\prime} \leq T$ implies that $T \unlhd L$ ．

Theorem 2．8．With notations of Theorem 2．1， $\operatorname{conj}_{a^{+}}(G)=\operatorname{conj}_{a^{-}}(G)=\operatorname{conj}_{a^{+}}\left(H^{+}\right) \cup$ $\left(\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right)^{-}$．In particular，$\left|\operatorname{conj}_{a^{+}}(G)\right|=\left|\operatorname{conj}_{a^{-}}(G)\right|=2\left|\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right|$．

Proof. Suppose $b^{\delta}$ is an arbitrary element of $G$. Then, we have

$$
\begin{aligned}
\operatorname{conj}_{a^{+}}(G) & =\left\{\left(a^{+} \otimes b^{\delta}\right) \boxtimes a^{+} \mid b^{\delta} \in G\right\} \\
& =\left\{\left(a^{+} \otimes b^{+}\right) \boxtimes a^{+} \mid b^{+} \in G\right\} \cup\left\{\left(a^{+} \otimes b^{-}\right) \boxtimes a^{+} \mid b^{-} \in G\right\} \\
& =\left\{\left(a^{+} \oplus b^{+}\right) \boxtimes a^{+} \mid b^{+} \in H^{+}\right\} \cup\left\{\left(a^{+} \oplus b^{+}\right)^{-} \boxtimes a^{+} \mid b^{-} \in H^{-}\right\} \\
& =\left\{\left(a^{+} \oplus b^{+}\right) \boxtimes a^{+} \mid b^{+} \in H^{+}\right\} \cup\left\{\left(\left(a^{+} \oplus b^{+}\right) \boxminus a^{+}\right)^{-} \mid b^{+} \in H^{+}\right\} \\
& =\operatorname{conj}_{a^{+}}\left(H^{+}\right) \cup\left(\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right)^{-} . \\
\operatorname{conj}_{a^{-}}(G) & =\left\{\left(a^{-} \otimes b^{\delta}\right) \boxtimes a^{-} \mid b^{\delta} \in G\right\} \\
& =\left\{\left(a^{-} \otimes b^{+}\right) \boxtimes a^{-} \mid b^{+} \in G\right\} \cup\left\{\left(a^{-} \otimes b^{-}\right) \boxtimes a^{-} \mid b^{-} \in G\right\} \\
& =\left\{\left(a^{+} \oplus b^{+}\right)-\boxtimes a^{-} \mid b^{+} \in H^{+}\right\} \cup\left\{\left(a^{+} \oplus b^{+}\right) \boxtimes a^{-} \mid b^{-} \in H^{-}\right\} \\
& =\left\{\left(a^{+} \oplus b^{+}\right) \boxtimes a^{+} \mid b^{+} \in H^{+}\right\} \cup\left\{\left(\left(a^{+} \oplus b^{+}\right) \boxminus a^{+}\right)^{-} \mid b^{+} \in H^{+}\right\} \\
& =\operatorname{conj}_{a^{+}}\left(H^{+}\right) \cup\left(\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right)^{-}
\end{aligned}
$$

This shows that $\operatorname{conj}_{a^{+}}(G)=\operatorname{conj}_{a^{-}}(G)=\operatorname{conj}_{a^{+}}\left(H^{+}\right) \cup\left(\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right)^{-}$. Since $\operatorname{conj}_{a^{+}}\left(H^{+}\right)$ $\cap\left(\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right)^{-}=\varnothing$ and $\left|\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right|=\left|\left(\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right)^{-}\right|,\left|\operatorname{conj}_{a^{+}}(G)\right|=2\left|\operatorname{conj}_{a^{+}}\left(H^{+}\right)\right|$ which completes the proof.

Theorem 2.9. With notations of Theorem 2.1, $\left(H^{+}\right)^{\prime}=G^{\prime}$
Proof. Suppose that $a^{\varepsilon}$ and $b^{\delta}$ are arbitrary elements of $G$. We first prove that a commutator of two elements in $G$ is equal to a commutator of some elements in $H^{+}$. To do this, the following two cases are considered:

1. $(\varepsilon, \delta)=(+,+)$ or $(-,-)$. Then,

$$
\begin{aligned}
{\left[a^{\varepsilon}, b^{\delta}\right]_{G} } & =\odot\left(a^{\varepsilon} \otimes b^{\delta}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(b^{\delta} \otimes a^{\varepsilon}\right) \\
& =\odot\left(a^{+} \oplus b^{+}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(b^{+} \oplus a^{+}\right) \\
& =\ominus\left(a^{+} \oplus b^{+}\right) \otimes g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(b^{+} \oplus a^{+}\right) \\
& =\ominus\left(a^{+} \oplus b^{+}\right) \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(b^{+} \oplus a^{+}\right) \\
& =\left[a^{+}, b^{+}\right]_{H^{+}} .
\end{aligned}
$$

2. $(\varepsilon, \delta)=(-,+)$ or $(+,-)$. In this case,

$$
\begin{aligned}
{\left[a^{\varepsilon}, b^{\delta}\right]_{G} } & =\oslash\left(a^{\varepsilon} \otimes b^{\delta}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(b^{\delta} \otimes a^{\varepsilon}\right) \\
& =\oslash\left(\left(a^{+} \oplus b^{+}\right)^{-}\right) \otimes g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(\left(b^{+} \oplus a^{+}\right)^{-}\right) \\
& =\left(\ominus\left(a^{+} \oplus b^{+}\right)\right)^{-} \otimes\left(g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(b^{+} \oplus a^{+}\right)\right)^{-} \\
& =\ominus\left(a^{+} \oplus b^{+}\right) \oplus g y r_{H^{+}}\left[a^{+}, b^{+}\right]\left(b^{+} \oplus a^{+}\right) \\
& =\left[a^{+}, b^{+}\right]_{H^{+}} .
\end{aligned}
$$

This proves that $G^{\prime}=\langle[x, y] \mid x, y \in G\rangle=\left\langle[x, y] \mid x, y \in H^{+}\right\rangle=\left(H^{+}\right)^{\prime}$, proving the lemma.

Theorem 2.10. If $G$ and $H^{+}$are finite gyrogroups as in Theorem 2.1, then $H^{+} \unlhd G$.
Proof. Note that $\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(H^{+}\right)=\left\{g y r_{G}\left[a^{\varepsilon}, b^{\delta}\right] c^{+} \mid c^{+} \in H^{+}\right\}$. By Theorem 2.1, $\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right] c^{+}=$gyr $_{H^{+}}\left[a^{+}, b^{+}\right] c^{+}$. On the other hand, gyr $_{H^{+}}\left[a^{\varepsilon}, b^{\delta}\right] \in \operatorname{Aut}\left(H^{+}\right)$and hence $\operatorname{gyr}_{G}\left[a^{\varepsilon}, b^{\delta}\right]\left(H^{+}\right) \subseteq H^{+}$. Since $\left[G: H^{+}\right]=2$, by [5, Theorem 4.5], we have $H^{+} \unlhd G$.

Theorem 2.11. Suppose that $H^{+}$and $G$ are gyrogroups as in Theorem 2.1. If $B$ is a subgyrogroup of $G$ such that $B \nsubseteq H^{+}$, then the following hold:
(1) There exists $A^{+} \leq H^{+}$and $L^{-} \subseteq H^{-}$such that $B=A^{+} \cup L^{-}$;
(2) $A^{+} \cap L^{+}=\varnothing$ or $L^{+}=A^{+}$, where $L^{+}=\varphi^{-1}\left(L^{-}\right)$;
(3) $A^{+} \cup L^{+} \leq H^{+}$;
(4) $\left|A^{+}\right|=\left|L^{-}\right|$.

Proof. (1) It is easy to see that $B \nsubseteq H^{-}$. Set $A^{+}=B \cap H^{+}$and $L^{-}=B \cap H^{-}$. Assume that $B \leq G, B \nsubseteq H^{+}$and $B \nsubseteq H^{-}$then $A^{+}$and $L^{-}$are not empty sets. Also $A^{+} \leq H^{+}$, $L^{-} \subseteq H^{-}$and $B=A^{+} \cup L^{-}$.
(2) Suppose $A^{+} \cap L^{+} \neq \varnothing$. We prove that $L^{+}=A^{+}$. First we show $A^{+} \cap L^{+}$is a subgyrogroup of $H^{+}$. To do this, we choose two elements $a^{+}, b^{+} \in A^{+} \cap L^{+}$. Since $A^{+} \leq H^{+}, a^{+} \oplus b^{+} \in A^{+}$. On the other hand, $a^{+} \in A^{+} \subseteq B, b^{-} \in L^{-} \subseteq B$ and $B \leq G$, it can easily see that $\left(a^{+} \oplus b^{+}\right)^{-}=a^{+} \otimes b^{-} \in B \cap H^{-}=L^{-}$. This proves that $a^{+} \oplus b^{+} \in L^{+}$and so $a^{+} \oplus b^{+} \in A^{+} \cap L^{+}$. We now apply [3, Proposition 22] to deduce that $A^{+} \cap L^{+} \leq H^{+}$.

Now, we have to show that $L^{+}=A^{+}$. Suppose that $b^{+} \in L^{+}$is arbitrary. Since $A^{+} \cap L^{+} \leq H^{+}, 0^{+} \in A^{+} \cap L^{+}$. Thus, $0^{-}, b^{-} \in L^{-} \subseteq B$. But $B \leq G$, so $0^{-} \otimes b^{-}=$ $0^{+} \oplus b^{+}=b^{+} \in B=A^{+} \cup L^{-}$. This means that $b^{+} \in A^{+}$and therefore $L^{+} \subseteq A^{+}$. To prove the converse, let $b^{+} \in A^{+}$. Note that $0^{+} \in A^{+} \cap L^{+}$and so $0^{-} \in L^{-} \subseteq B$. But
$0^{-} \otimes b^{+}=\left(0^{+} \oplus b^{+}\right)^{-}=b^{-} \in B=A^{+} \cup L^{-}$. This shows that $b^{+} \in L^{+}$, i.e., $A^{+} \subseteq L^{+}$. Therefore, $L^{+}=A^{+}$.
(3) Define $K=A^{+} \cup L^{+}$. We will prove that $(K, \oplus)$ is a subgyrogroup of $H^{+}$. To do this, we choose the elements $a^{+}$and $b^{+}$in $K$. If $a^{+}, b^{+} \in A^{+}$then $a^{+} \oplus b^{+} \in A^{+} \subseteq K$, since $A^{+} \leq H^{+}$as desired. If $a^{+}, b^{+} \in L^{+}$, then $a^{-}, b^{-} \in L^{-}=B \cap H^{-} \subseteq B$. This shows that $a^{-} \otimes b^{-} \in B$. On the other hand, $a^{-} \otimes b^{-}=a^{+} \oplus b^{+} \in B \cap H^{+}=A^{+} \subseteq K$. We now assume that $a^{+} \in A^{+}$and $b^{+} \in L^{+}$. It is clear that $\left(a^{+} \oplus b^{+}\right)^{-} \in H^{-}$. Since $a^{+} \in A^{+} \subseteq B$ and $b^{-} \in L^{-} \subseteq B,\left(a^{+} \oplus b^{+}\right)^{-}=a^{+} \otimes b^{-} \in B$. Thus, $\left(a^{+} \oplus b^{+}\right)^{-} \in B \cap H^{-}=L^{-}$and so $a^{+} \oplus b^{+} \in L^{+} \subseteq K$. Finally, suppose that $a^{+} \in L^{+}$and $b^{+} \in A^{+}$. A similar argument proves that $a^{+} \oplus b^{+} \in L^{+} \subseteq K$. Therefore, by [3, Proposition 22], $K$ is a subgyrogroup of $H^{+}$.
(4) By (1) $A^{+}$and $L^{-}$are not empty sets. Let $A^{+}=\left\{a_{1}^{+}, \ldots, a_{n}^{+}\right\}$. Since $L^{-} \neq \varnothing$, there exists an element $x^{-} \in L^{-}$. So $x^{-} \otimes a_{i}^{+}=\left(x^{+} \oplus a_{i}^{+}\right)^{-} \in B \cap H^{-}=L^{-}$. This shows that $x^{-} \otimes A^{+}=\left\{x^{-} \otimes a_{1}^{+}, \ldots, x^{-} \otimes a_{n}^{+}\right\} \subseteq L^{-}$. On the other hand, by the left cancelation law the elements of $x^{-} \otimes A^{+}$are distinct thus $\left|A^{+}\right| \leq\left|L^{-}\right|$. A similar argument proves that if $L^{-}=\left\{b_{1}^{-}, \ldots, b_{m}^{-}\right\}$, then for each $y^{-} \in L^{-}, y^{-} \otimes L^{-}=\left\{y^{-} \otimes b_{1}^{-}, \ldots, y^{-} \otimes b_{m}^{-}\right\} \subseteq A^{+}$. Therefore, $\left|L^{-}\right| \leq\left|A^{+}\right|$, which proves the result.
Hence the result.

Theorem 2.12. Suppose that $H^{+}$and $G$ are gyrogroups of Theorem 2.1. A non-empty subset $B$ of $G$ is a subgyrogroup of $G$ if and only if one of the following hold:
(1) $B \leq H^{+}$;
(2) There exists $A^{+} \leq H^{+}$and $L^{-} \subseteq H^{-}$such that $B=A^{+} \cup L^{-}$with the property that for each $x, y \in L^{-}$, we have $x \otimes y \in A^{+}$. Also $A^{+} \cap L^{+}=\varnothing$ and $A^{+} \cup L^{+} \leq H^{+}$that $L^{+}=\varphi^{-1}\left(L^{-}\right) ;$
(3) $B=A^{+} \cup A^{-}$such that $A^{+} \leq H^{+}$and $A^{-}=\varphi\left(A^{+}\right)$.

Proof. Let $B$ be a subgyrogroup of $G$. If $B \subseteq H^{+}$, then there is nothing to prove. Hence it is enough to consider the case where $B \nsubseteq H^{+}$. By Theorem 2.11, the conditions (2) and (3) are true.

Conversely, we assume that $B$ is a nonempty subset of $G$ which satisfies the conditions of the theorem.
(1) If $B \leq H^{+}$then there is nothing to prove.
(2) Suppose that $B$ satisfy the condition (2). By [3, Proposition 22], it is enough to prove that $B$ is closed under the operation of $G$. We choose arbitrary elements $a^{\varepsilon}$ and $b^{\delta}$ from $B$. We first assume that $a^{\varepsilon}, b^{\delta} \in A^{+}$. Then $\varepsilon=\delta=+$ and since $A^{+} \leq H^{+}$, $a^{\varepsilon} \otimes b^{\delta}=a^{+} \otimes b^{+}=a^{+} \oplus b^{+} \in A^{+} \subseteq B$, as desired. Furthermore, if $a^{\varepsilon}, b^{\delta} \in L^{-}$, then by
our assumption $a^{\varepsilon} \otimes b^{\delta} \in A^{+} \subseteq B$, which is our goal. We now assume that $a^{+} \in A^{+}$ and $b^{-} \in L^{-}$. Since $A^{+} \cup L^{+}$is a subgyrogroup of $H^{+}, a^{+} \oplus b^{+} \in A^{+} \cup L^{+}$. We claim that $a^{+} \oplus b^{+} \in L^{+}$; otherwise, $a^{+} \oplus b^{+} \in A^{+}$and $b^{+}=\ominus a^{+} \oplus\left(a^{+} \oplus b^{+}\right) \in A^{+} \cap L^{+}$, a contradiction. Thus, $a^{+} \oplus b^{+} \in L^{+}$and hence $a^{\varepsilon} \otimes b^{\delta}=a^{+} \otimes b^{-}=\left(a^{+} \oplus b^{+}\right)^{-} \in L^{-} \subseteq B$, as imagined. For the final case, we assume that $a^{-} \in L^{-}$and $b^{+} \in A^{+}$. Since $A^{+} \cup L^{+}$ is a subgyrogroup of $H^{+}, a^{+} \oplus b^{+} \in A^{+} \cup L^{+}$. We claim that $a^{+} \oplus b^{+} \in L^{+}$. Otherwise, $a^{+} \oplus b^{+} \in A^{+}$and $a^{+}=\left(a^{+} \oplus b^{+}\right)$日 $b^{+} \in A^{+} \cap L^{+}$, a contradiction. Thus, $a^{+} \oplus b^{+} \in L^{+}$ and hence $a^{-} \otimes b^{+}=\left(a^{+} \oplus b^{+}\right)^{-} \in L^{-} \subseteq B$, which completes this part of the task.
(3) In this case, we have to prove that $B=A^{-} \cup A^{+}$is closed under the operation $\otimes$. To see this, we choose arbitrary elements $a^{\varepsilon}$ and $b^{\delta}$ in $B$. We first assume that $a^{+}, b^{+} \in A^{+}$. Since $A^{+} \leq H^{+}, a^{+} \otimes b^{+}=a^{+} \oplus b^{+} \in A^{+} \subseteq B$, as desired. If $a^{-}, b^{-} \in A^{-}$, then $a^{+}, b^{+} \in A^{+}$. Since $A^{-} \subseteq G$ and $A^{+} \leq H^{+}, a^{-} \otimes b^{-}=a^{+} \oplus b^{+} \in A^{+} \subseteq B$ which is again our goal. Next we assume that $a^{+} \in A^{+}$and $b^{-} \in A^{-}$. Since $A^{+} \leq H^{+}, a^{+} \oplus b^{+} \in A^{+}$. On the other hand, $a^{+}, b^{-} \in G$ hence $a^{+} \otimes b^{-}=\left(a^{+} \oplus b^{+}\right)^{-} \in A^{-} \subseteq B$, as imagined. For the final case, a similar argument proves that if $a^{-} \in A^{-}$and $b^{+} \in A^{+}$, then $a^{-} \otimes b^{+}=$ $\left(a^{+} \oplus b^{+}\right)^{-} \in A^{-} \subseteq B$

Hence the result.

## 3. Concluding Remarks

A gyrogroup of a prime power order $p^{n}$ is called a $p$-gyrogroup. In this paper, a method for constructing new gyrogroups from the old ones is presented by which it is possible to construct five non-isomorphic 2 -gyrogroups of order $2^{n}, n \geq 3$. To do this, it is enough to consider the gyrogroups $K(1), L(1), M(1), N(1)$ and $O(1)$ of order eight defined in Tables 1 and 2. Then apply Theorem 2.1 to construct five gyrogroups of order 16 and so on. In the general case, a characterization of the subgyrogroups of new constructed gyrogroup $G$ with respect to the gyrogroup $H^{+}$were given. Two open questions for future study were posed.
